3. Functors on Drinfeld centers
4. Monoidal Kleisli and Eilenberg–Moore adjunctions
5. Functors of Yetter–Drinfeld modules
6. Outlook

# Motivation — Morphisms of centers

## Classical problem:

- $f: R \rightarrow S$  is a morphism of rings
- No restriction to a map  $Z(R) \rightarrow Z(S)$  in general

## Categorical analogues:

- Ring  $(A, m, 1) \rightsquigarrow$  monoidal category  $(\mathcal{C}, \otimes, \mathbb{1})$
- Center  $Z(A) \rightsquigarrow$  *Drinfeld center*  $\mathcal{Z}(\mathcal{C})$
- Morphism of rings  $\rightsquigarrow$  (strong) monoidal functor  $G: \mathcal{C} \rightarrow \mathcal{D}$

$$\begin{array}{ccc} & \sim & \\ & \text{lax}_{A,B}^G & \\ G(A) \otimes G(B) & \xrightarrow{\quad} & G(A \otimes B) \\ & \text{oplax}_{A,B}^G & \\ & \sim & \end{array} \quad + \quad \text{coherences} \dots$$

- **Result (Flake–L.–Posur):** The right adjoint of  $G$  (often) induces a *braided lax monoidal* functor  $\mathcal{Z}(R): \mathcal{Z}(\mathcal{D}) \rightarrow \mathcal{Z}(\mathcal{C})$ .

# Some motivating examples

- $\phi: H \hookrightarrow G$  finite groups,  $\omega \in H^3(G, \mathbb{k}^\times)$  3-cocycle,

$$\mathcal{Z}(\text{Rep } H) \rightarrow \mathcal{Z}(\text{Rep } G) \quad [\text{Flake-Harman-L.}]$$

$$\mathcal{Z}(\text{Vect}_H^{\phi^* \omega}) \rightarrow \mathcal{Z}(\text{Vect}_G^\omega) \quad [\text{Hannah-L.-Ros Camacho}]$$

*braided Frobenius monoidal* functors

- **Application:** classifying **connected étale algebras** in  $\mathcal{Z}(\text{Vect}_G^\omega)$  [Davydov, Davydov-Simmons, L.-Walton, H.-L.-R.C.]
- For all  $n \in \mathbb{Z}_{\geq 0}$ ,  $t \in \mathbb{C}$ ,

$$\underline{\text{Ind}}: \mathcal{Z}(\text{Rep } S_n) \longrightarrow \mathcal{Z}(\underline{\text{Rep}} S_t)$$

*braided Frobenius monoidal* functor [Flake-Harman-L.]

- **Application:** classify indecomposable objects in  $\mathcal{Z}(\underline{\text{Rep}} S_t)$  [F.-H.-L.]

**Goal:** General results on induced functors on centers

# Background — The Drinfeld center

$\mathcal{C}$  monoidal category,  $\mathcal{M}$  a  $\mathcal{C}$ -bimodule

Definition ( $\mathcal{Z}_{\mathcal{C}}(\mathcal{M})$ , Gelaki–Naidu–Nikshych, Greenough, ...)

- Objects:**  $(M, c)$ , where  $M \in \mathcal{M}$  and  $c$  *half-braiding*, a natural isomorphism  $c_A^M: M \triangleleft A \xrightarrow{\sim} A \triangleright M$  satisfying:

$$c_{A \otimes B}^M = (A \triangleright c_B^M)(c_A^M \triangleleft B)$$

- Morphisms:**  $f: (M, c^M) \rightarrow (N, c^N)$  corresponds to  $f \in \text{Hom}_{\mathcal{M}}(M, N)$  s.t.:

$$\begin{array}{ccc} M \triangleleft A & \xrightarrow{c_A^M} & A \triangleright M \\ \downarrow f \triangleleft A & & \downarrow A \triangleright f \\ N \triangleleft A & \xrightarrow{c_A^N} & A \triangleright N. \end{array}$$

# Background — The Drinfeld center

## Special cases:

- $\mathcal{C}^{\text{reg}}$  — the *regular*  $\mathcal{C}$ -bimodule, action via  $\otimes$
- $\mathcal{Z}(\mathcal{C}) := \mathcal{Z}_{\mathcal{C}}(\mathcal{C}^{\text{reg}})$  is *braided monoidal* — the *Drinfeld center* of  $\mathcal{C}$
- A *monoidal functor*  $G: \mathcal{C} \rightarrow \mathcal{D}$  makes  $\mathcal{D}$  a  $\mathcal{C}$ -bimodule,  $\mathcal{D}^G$  — restricting  $\mathcal{D}^{\text{reg}}$  along  $G$
- $\mathcal{Z}_{\mathcal{C}}(\mathcal{D}^G)$  is a *monoidal category* [Majid]

## Proposition (2-Functoriality [Shimizu])

A  $\mathcal{C}$ -bimodule functor  $F: \mathcal{M} \rightarrow \mathcal{N}$  induces a functor of categories

$$\mathcal{Z}_{\mathcal{C}}(F): \mathcal{Z}_{\mathcal{C}}(\mathcal{M}) \rightarrow \mathcal{Z}_{\mathcal{C}}(\mathcal{N}).$$

Bimodule transformation  $\eta: F \rightarrow G$  gives a natural transformation  
 $\mathcal{Z}_{\mathcal{C}}(\eta): \mathcal{Z}_{\mathcal{C}}(F) \rightarrow \mathcal{Z}_{\mathcal{C}}(G) \implies 2\text{-functor } \mathcal{Z}_{\mathcal{C}}: \mathcal{C}\text{-BiMod} \rightarrow \mathbf{Cat}$

# Monoidal adjunctions

Define a **2-category**  $\mathbf{Cat}_{\text{lax}}^{\otimes}$ :

- **Objects:** monoidal categories
- **1-Morphisms:** *lax* monoidal functors
- **2-Morphisms:** *monoidal* natural transformations  $\eta: F \rightarrow G$ :

$$\begin{array}{ccc} F(X) \otimes F(Y) & \xrightarrow{\text{lax}_{X,Y}^F} & F(X \otimes Y) \\ \downarrow \eta_X \otimes \eta_Y & & \downarrow \eta_{X \otimes Y} \\ G(X) \otimes G(Y) & \xrightarrow{\text{lax}_{X,Y}^G} & G(X \otimes Y) \end{array}$$

$$\begin{array}{ccc} & \mathbb{1} & \\ \text{lax}_0^G \swarrow & & \searrow \text{lax}_0^F \\ F(\mathbb{1}) & \xrightarrow{\eta_1} & G(\mathbb{1}) \end{array}$$

## Definition (Monoidal adjunction)

A **monoidal adjunction**  $G \dashv R$  is an adjunction *internal* to  $\mathbf{Cat}_{\text{lax}}^{\otimes}$ .

- $G \dashv R$  monoidal adjunction  $\implies G$  is *strong* monoidal
- $G$  strong monoidal  $\implies \exists!$  lax structure on  $R$  s.t.  $G \dashv R$  is monoidal

# The projection formula morphisms

## Definition (Projection formula morphisms)

$$\begin{array}{ccccc}
 & & \text{proj}_{A,X}^l & & \\
 & \nearrow & & \searrow & \\
 A \otimes RX & \xrightarrow{\text{unit}_A \otimes \text{id}} & RG(A) \otimes RX & \xrightarrow{\text{lax}_{GA,X}} & R(GA \otimes X)
 \end{array}$$

If  $\text{proj}^l$  and  $\text{proj}^r$  are invertible, say: the *projection formula holds* for  $R$ .

- In **representation theory** (*Frobenius reciprocity*):  $H \subset G$  finite groups,  $\text{Ind} \dashv \text{Res}$  (op)monoidal adjunction,

$$\text{proj}_{V,W}^l: \text{Ind}_H^G(\text{Res}_H^G(V) \otimes W) \xrightarrow{\sim} V \otimes \text{Ind}_H^G(W)$$

- In **algebraic geometry**:  $f: X \rightarrow Y$  morphism of schemes,  $f^* \dashv f_*$ ,  $\mathcal{E} \in \mathbf{QCoh}(Y)$ ,  $\mathcal{F} \in \mathbf{QCoh}(X)$  locally free,

$$\text{proj}_{\mathcal{E},\mathcal{F}}^l: \mathcal{E} \otimes_{\mathcal{O}_X} f_*(\mathcal{F}) \xrightarrow{\sim} f_*(f^*(\mathcal{E}) \otimes_{\mathcal{O}_X} \mathcal{F})$$

# The projection formula morphisms

- If  $\mathcal{C}, \mathcal{D}$  have finite products, they are monoidal categories with  $\otimes = \times$ , these are *cartesian closed* if  $(-)\times A$  has a right adjoint  $(-)^A$ .  
A product preserving functor  $G: \mathcal{C} \rightarrow \mathcal{D}$  with *left adjoint* gives a (op)monoidal adjunction  $L \dashv G$ .
- Such  $G$  is *cartesian closed*, i.e,  $G(A^B) \simeq GA^{GB} \iff$   
$$\mathrm{proj}_{A,X}^l = (\mathrm{counit}_A L\pi_A, L\pi_X): L(GA \times X) \xrightarrow{\sim} A \times LX$$
  
is an isomorphism [Johnstone]

A sufficient criterion:

**Proposition (Fausk–Hu–May, Flake–L.–Posur)**

$\mathcal{C}$  *rigid* (left and right duals exist)  $\implies$  the projection formula holds for  $R$

# Categorical bimodule functors

## Proposition (F.–L.–P.)

Let  $G \dashv R$  be a monoidal adjunction.

projection formula  $\implies$  *morphism of  $\mathcal{C}$ -bimodules*  $R: \mathcal{D}^G \rightarrow \mathcal{C}$  with:

$$\begin{array}{ccc} R(A \triangleright X) & \xrightarrow{\text{lin}_{A,X}^l} & A \triangleright RX \\ \parallel & & \parallel \\ R(GA \otimes X) & \xrightarrow{(\text{proj}_{A,X}^l)^{-1}} & A \otimes RX \end{array} \quad \begin{array}{ccc} R(X \triangleleft A) & \xrightarrow{\text{lin}_{X,A}^r} & RX \triangleleft A \\ \parallel & & \parallel \\ R(X \otimes GA) & \xrightarrow{(\text{proj}_{X,A}^r)^{-1}} & RX \otimes A \end{array}$$

*Monoidal adjunction:* *Monoidal adjunctions* of  $\mathcal{C}$ -bimodules/categories:

$$\begin{array}{ccc} \mathcal{C} & \begin{array}{c} \swarrow G \\ \perp \\ \searrow R \end{array} & \mathcal{D}^G \\ & \implies & \\ \mathcal{Z}_{\mathcal{C}}(\mathcal{C}) & \begin{array}{c} \swarrow \mathcal{Z}_{\mathcal{C}}(G) \\ \perp \\ \searrow \mathcal{Z}_{\mathcal{C}}(R) \end{array} & \mathcal{Z}_{\mathcal{C}}(\mathcal{D}^G) \end{array}$$

... since  $\mathcal{Z}_{\mathcal{C}}: \mathcal{C}\text{-BiMod} \rightarrow \mathbf{Cat}$  is a *2-functor*

# Functors on Drinfeld centers

We can now **compose**:

$$\begin{array}{ccc} \mathcal{Z}(\mathcal{D}) & \xrightarrow{\mathcal{Z}(R)} & \mathcal{Z}_{\mathcal{C}}(\mathcal{C}) = \mathcal{Z}(\mathcal{C}) \\ & \searrow F^G & \nearrow \mathcal{Z}_{\mathcal{C}}(R) \\ & \mathcal{Z}_{\mathcal{C}}(\mathcal{D}^G) & \end{array}$$

$$F^G: \mathcal{Z}(\mathcal{D}) \hookrightarrow \mathcal{Z}(\mathcal{D}^G), \quad (M, c^M) \mapsto (M, c_{G(-)}^M)$$

## Theorem (Flake–L.–Posur)

For a *monoidal adjunction*  $G \dashv R$  satisfying the *projection formula*,  $R$  induces a *braided lax monoidal functor*  $\mathcal{Z}(R): \mathcal{Z}(\mathcal{D}) \rightarrow \mathcal{Z}(\mathcal{C})$ ,  $(X, c) \mapsto (RX, c^R)$ ,

$$c_A^R = \left( RX \otimes A \xrightarrow{\text{proj}_{X,A}^r} R(X \otimes GA) \xrightarrow{R(c_{GA})} R(GA \otimes X) \xrightarrow{(\text{proj}_{A,X}^l)^{-1}} A \otimes RX \right).$$

$$\text{lax}_{(X,c),(Y,d)}^{\mathcal{Z}(R)} = \text{lax}_{X,Y}^R \qquad \text{lax}_0^{\mathcal{Z}(R)} = \text{lax}_0^R$$

## Corollary

The functor  $\mathcal{Z}(\mathcal{D}) \xrightarrow{\mathcal{Z}(R)} \mathcal{Z}(\mathcal{C})$  maps *(commutative) monoids* in  $\mathcal{Z}(\mathcal{D})$  to *(commutative) monoids* in  $\mathcal{Z}(\mathcal{C})$ .

## Example:

- $H \subset G$  finite groups, **monoidal adjunction**  $\text{Rep}(G) \begin{matrix} \xrightarrow{\text{Res}} \\ \perp \\ \xleftarrow{\text{CoInd} \simeq \text{Ind}} \end{matrix} \text{Rep}(H)$
- $\mathcal{Z}(\text{Rep } H) \simeq {}^H_H\mathbf{YD}$  — **Yetter–Drinfeld modules**  
**Objects:**  $V \in \text{Rep } H$  with coaction  $\delta: V \rightarrow H \otimes V$ ,  $v \mapsto |v| \otimes v$ ,  
satisfying  $|h \cdot v| = h|v|h^{-1}$
- Obtain **braided lax monoidal functor**  $\mathcal{Z}(R): {}^H_H\mathbf{YD} \rightarrow {}^G_G\mathbf{YD}$ ,  
 $\mathcal{Z}(R)(V) = G \otimes_H V$  with coaction  $\delta^{\text{Ind}}(g \otimes v) = g|v|g^{-1} \otimes v$

## Definition

A *monoidal monad*  $T: \mathcal{C} \rightarrow \mathcal{C}$  is a monad in  $\mathbf{Cat}_{\text{lax}}^{\otimes}$ .

**This means:**

- $T$  is a monad
- $\mathcal{C}$  a monoidal category
- $T$  comes equipped with a lax structure  
 $\text{lax}_{A,B}^T: T(A) \otimes T(B) \rightarrow T(A \otimes B)$
- $\text{unit}_A^T: A \rightarrow T(A)$  and  $\text{mult}_A^T: T^2(A) \rightarrow T(A)$  are *monoidal* transformations

## Lemma

$G \dashv R$  *monoidal adjunction*  $\implies T := RG$  *monoidal monad*

# Commutative central monoids

## Definition (Schauenburg ...)

A **commutative central monoid**  $M$  in  $\mathcal{C}$  is an **commutative monoid**  $(M, c^M)$  in  $\mathcal{Z}(\mathcal{C})$ . Structure:  $\text{mult}^M : M \otimes M \rightarrow M$ ,  $\text{unit}^M : \mathbb{1} \rightarrow M$ .

- Now construct the **monad**

$$T_M : \mathcal{C} \rightarrow \mathcal{C}, \quad A \mapsto A \otimes M.$$

$$\text{unit}_A^T := A \xrightarrow{A \otimes \text{unit}^M} A \otimes M, \quad \text{mult}_A^T := A \otimes M \otimes M \xrightarrow{A \otimes \text{mult}^M} A \otimes M$$

- Lax structure:**  $\text{lax}_0^T := \mathbb{1} \xrightarrow{\text{unit}^M} M$  and

$$\text{lax}_{A,B}^T := A \otimes M \otimes B \otimes M \xrightarrow{A \otimes \text{swap}_B \otimes M} A \otimes B \otimes M \otimes M \xrightarrow{A \otimes B \otimes \text{mult}^M} A \otimes B \otimes M$$

## Proposition

$M$  **commutative central monoid**  $\implies T_M$  **monoidal monad**

# Commutative central monoids

Another interpretation of the **projection formula morphisms**:

## Proposition (F.–L.–P.)

Let  $G \dashv R$  be a **monoidal adjunction** such that the **projection formula** holds.

(i) Then  $M := R(\mathbb{1})$  with

$$c^{R\mathbb{1}} := R\mathbb{1} \otimes A \xrightarrow{\text{proj}_{\mathbb{1}, A}^r} RA \xrightarrow{(\text{proj}_{A, \mathbb{1}}^l)^{-1}} A \otimes R\mathbb{1}$$

$$\text{mult} = \text{lax}_{\mathbb{1}, \mathbb{1}}^R \quad \text{and} \quad \text{unit} = \text{lax}_0^R: \mathbb{1} \rightarrow R\mathbb{1}$$

is a **commutative central monoid** in  $\mathcal{C}$ .

(ii)  $T_M = (-) \otimes R(\mathbb{1}) \xrightarrow{\text{proj}_{-, \mathbb{1}}^l} RG(-)$  **isomorphism** of **monoidal monads**.

**Example:**  $H \subset G$  groups, **monoidal adjunction**  $\text{Res} \dashv \text{CoInd}$ .

$\Rightarrow R(\mathbb{1}) = \text{CoInd}(\mathbb{k}) = \text{Hom}_{\text{Rep}(H)}(\mathbb{k}G, \mathbb{k}) \cong \mathbb{k}(G/H)$ , the **algebra of functions** on  $G/H$ . **Note:**  $\text{Mod}_{\text{Rep}(G)}\text{-}\mathbb{k}(G/H) \simeq \text{Rep}(H)$  [Kirillov–Ostrik]

# Monoidal Kleisli adjunctions

**Assumption:**  $G \dashv R$  is an adjunction such that  $RG = T$ .

- Kleisli category  $\mathbf{Klei}(T)$ :
  - Same objects as  $\mathcal{C}$
  - Morphisms  $\text{Hom}_{\mathbf{Klei}(T)}(A, B) = \text{Hom}_{\mathcal{C}}(A, TB)$
- Diagram of functors:

- $T$  *monoidal monad*  $\implies \mathbf{Klei}(T)$  *monoidal category*
  - Same tensor product  $\otimes$  of objects as  $\mathcal{C}$ , same unit  $1$
  - tensor product of morphisms:

$$A \otimes C \xrightarrow{f \otimes g} TB \otimes TD \xrightarrow{\text{lax}_{B,D}^T} T(B \otimes D) \in \text{Hom}_{\mathbf{Klei}(T)}(A \otimes C, B \otimes D)$$

# Monoidal Kleisli adjunctions

## Theorem (Universal property, F.–L.–P.)

Assume  $T$  is a *monoidal monad*.

- (i) The *adjunction*  $\mathcal{C} \begin{array}{c} \xrightarrow{\text{Free}} \\ \perp \\ \xleftarrow{\text{Forg}} \end{array} \mathbf{Klei}(T)$  becomes a *monoidal adjunction*.
- (ii)  $\text{Free} \dashv \text{Forg}$  is the *initial monoidal adjunction*.

## Theorem (Characterization theorem, F.–L.–P.)

$G \dashv R$  *monoidal adjunction*

- (i) *projection formula* holds for  $R \Rightarrow$  *projection formula* holds for  $\text{Forg}$
- (ii)  $G$  is also *essentially surjective*  $\Rightarrow \tilde{G}: \mathbf{Klei}(T) \rightarrow \mathcal{D}$  *monoidal equivalence*

# Monoidal Kleisli adjunctions

## Example:

- $H$  finite-dimensional Hopf algebra, fiber functor  $F: H\text{-Mod} \rightarrow \text{Vect}_{\mathbb{k}}$  is
  - (i) strong monoidal
  - (ii) essentially surjective, and
  - (iii) the projection formula holds (by rigidity).
- $R(1) \cong H^*$  is a commutative central monoid.
- The **characterization theorem** implies:

$$\text{Vect}_{\mathbb{k}} \simeq \mathbf{Klei}(T_{H^*}) \simeq \{\text{free } H^* \text{ modules in } H\text{-Mod}\}$$

$\Rightarrow$  *Fundamental theorem of Hopf modules*

- **More generally:**  $B$  finite-dimensional Hopf algebra object in  ${}^K_K\mathbf{YD}$  set  $H := B \rtimes K$  — **Radford–Majid biproduct**.

- $H\text{-Mod} \begin{matrix} \xrightarrow{\text{Res}_K^H} \\ \xleftarrow{\text{CoInd}_K^H} \end{matrix} K\text{-Mod}$  is a monoidal adjunction satisfying (i)–(iii).
- $K\text{-Mod} \simeq \mathbf{Klei}(T_{B^*}) \simeq \{\text{free } B^*\text{-modules in } H\text{-Mod}\}$

# Monoidal Eilenberg–Moore categories

**Idea:** *free* modules (Kleisli)  $\rightsquigarrow$  *all* modules (Eilenberg–Moore)

**Recall:** Projection formula for  $G \dashv R \Rightarrow$  isomorphism of *monoidal monads*:

$$RG \cong T_M = (-) \otimes M$$

for the *commutative central monoid*  $M = R(\mathbb{1})$

## Corollary

*Eilenberg–Moore categories are given by  $\mathbf{Mod}_{\mathcal{C}}\text{-}M$ :*

- *Objects:* right  $M$ -modules internal to  $\mathcal{C}$
- *Morphisms:* morphisms in  $\mathcal{C}$  commuting with  $M$ -action

General construction of monoidal structure on Eilenberg–Moore category [\[Seal\]](#)

# Monoidal Eilenberg–Moore categories

**Assumption:**  $\mathcal{C}$  has *reflexive coequalizers* and  $\otimes$  preserves them in both components

Theorem (Pareigis, Schauenburg, . . .)

$\text{Mod}_{\mathcal{C}}\text{-}M$  is *monoidal* with relative tensor product

$$A \otimes M \otimes B \begin{array}{c} \xrightarrow{\text{act}^A \otimes B} \\ \xrightarrow{(A \otimes \text{act}^B) c_B^M} \end{array} A \otimes B \xrightarrow{\text{quo}_{A,B}} A \otimes_M B,$$

**Consequence:** Monoidal Eilenberg–Moore adjunction:

$$\begin{array}{ccc} & \text{Free} & \\ & \curvearrowright & \\ \mathcal{C} & & \text{Mod}_{\mathcal{C}}\text{-}M \\ & \curvearrowleft & \\ & \text{Forg} & \end{array} \quad \perp$$

# Monoidal Eilenberg–Moore categories

**Assumption:**  $\mathcal{C}$  has *reflexive coequalizers* and  $\otimes$  preserves them in both components.

## Theorem (Universal property, F.–L.–P.)

$G \dashv R$  *monoidal adjunction*, *projection formula holds* for  $R$

- (i) The *projection formula holds* for  $\text{Forg}$
- (ii) There is a unique induced *lax monoidal* functor  $\tilde{R}$ :

- (iii)  $\text{Free} \dashv \text{Forg}$  is the *terminal monoidal adjunction*.

**Note:** We can derive a *crude monoidal monadicity theorem*

## Definition (Local Modules [Pareigis])

$(M, c^M)$  commutative central monoid

$$\mathbf{Mod}_{\mathcal{Z}(c)}^{\text{loc}}-M \subseteq \mathbf{Mod}_{\mathcal{Z}(c)}-M$$

Full subcategory on *local*  $M$ -modules  $(A, \text{act}^A)$ , i.e.:

$$\text{act}^A \Psi_{M,A} \Psi_{A,M} = \text{act}^A.$$

$\mathbf{Mod}_{\mathcal{Z}(c)}^{\text{loc}}-M$  is braided monoidal [Pareigis]

## Theorem (Schauenburg)

*There is an equivalence of braided monoidal categories*

$$\mathcal{Z}(\mathbf{Mod}_c-M) \simeq \mathbf{Mod}_{\mathcal{Z}(c)}^{\text{loc}}-M.$$

**Assumption:**  $\mathcal{C}$  has *reflexive coequalizers* and  $\otimes$  preserves them in both components.

We can recognize the induced functor  $\mathcal{Z}(\text{Forg})$  on Drinfeld centers:

## Corollary (F.–L.–P.)

$\text{Forg}: \mathbf{Mod}_{\mathcal{C}}\text{-}M \rightarrow \mathcal{C}$  induces *braided lax monoidal* functor

$$\mathcal{Z}(\text{Forg}): \mathcal{Z}(\mathbf{Mod}_{\mathcal{C}}\text{-}M) \rightarrow \mathcal{Z}(\mathcal{C})$$

*Schauenburg's equivalence* implies  $\mathcal{Z}(\text{Forg})$  corresponds to

$$\text{Forg}^{\text{loc}}: \mathbf{Mod}_{\mathcal{Z}(\mathcal{C})}^{\text{loc}}\text{-}M \rightarrow \mathcal{Z}(\mathcal{C})$$

*Lax monoidal structure:* the coequalizer morphism  $A \otimes B \rightarrow A \otimes_M B$ .

# Functors of Yetter–Drinfeld modules

**Application:** functors of Yetter–Drinfeld categories over Hopf algebras.

- $\varphi: K \rightarrow H$  morphism of Hopf algebras:

$$\bullet \quad \begin{array}{ccc} & \text{Res}_\varphi & \\ & \curvearrowright & \\ H\text{-Mod} & \perp & K\text{-Mod} \\ & \curvearrowleft & \\ & \text{CoInd}_\varphi & \end{array} \quad \begin{array}{ccc} & \text{Res}^\varphi & \\ & \curvearrowright & \\ K\text{-Comod} & \perp & H\text{-Comod} \\ & \curvearrowleft & \\ & \text{Ind}^\varphi & \end{array}$$

- Comodule induction  $\text{Ind}^\varphi(V) = H \square_K V$  *always* satisfies the projection formula
- Module coinduction  $\text{CoInd}^\varphi(V) = \text{Hom}_K(H, V)$  satisfies the projection formula if  $H$  is *finitely-generated projective* as a left  $K$ -module.
- induced functors:

$$\mathcal{Z}(\text{CoInd}_\varphi): {}^K_K\mathbf{YD} \rightarrow {}^H_H\mathbf{YD} \quad \text{or} \quad \mathcal{Z}(\text{Ind}^\varphi): {}^H_H\mathbf{YD} \rightarrow {}^K_K\mathbf{YD}$$

# Examples

- Morphism of **affine algebraic groups**  $\phi: K \rightarrow G$  (morphism of Hopf algebras  $\varphi = \phi^*: \mathcal{O}_G \rightarrow \mathcal{O}_K$ )

- Braided lax monoidal functor

$$\mathcal{Z}(\text{Ind}^{\phi^*}): \mathbf{QCoh}(K/\text{ad}K) \rightarrow \mathbf{QCoh}(G/\text{ad}G).$$

- $\mathcal{Z}(\text{Rep } G) = \mathcal{Z}(\mathcal{O}_G\text{-Comod}) \simeq \mathbf{QCoh}(G/\text{ad}G)$ , quasi-coherent sheaves on the **quotient stack**  $G/\text{ad}G$

- Convolution tensor product

- **Kac–De Concini quantum group**  $U_\epsilon(\mathfrak{g})$  (odd root of unity  $\epsilon$ )

- **central** Hopf subalgebra  $\mathcal{O}_H$ , for  $H = (N^- \times N^+) \rtimes T$

- Inclusion  $\iota: \mathcal{O}_H \hookrightarrow U_\epsilon(\mathfrak{g})$

- induces a braided lax monoidal functor

$$\mathcal{Z}(\text{CoInd}_\iota): \mathbf{QCoh}(H/\text{ad}H) \longrightarrow {}^{U_\epsilon(\mathfrak{g})}_{U_\epsilon(\mathfrak{g})}\mathbf{YD},$$

- Image of  $1 = \mathbb{k}$ : central commutative monoidal  $u_\epsilon(\mathfrak{g})^* \cong \text{CoInd}_\iota(\mathbb{k})$  over  $U_\epsilon(\mathfrak{g})$

# Outlook — Frobenius monoidal functors

- Monoidal ambiadjunctions  $F \dashv G \dashv F$
- Left and right adjoint  $F$  both gives two projection formula morphisms
- If these are mutual inverses, the  $\mathcal{Z}(F)$  is a Frobenius monoidal functor
- Hopf algebra case: New concept of Frobenius monoidal extension of Hopf algebras

*... Thank you for your attention!*
